

High-performance centrifugal fans

Measuring device for determining air volume

The differential pressure compares the static pressure in front of the inlet ring with the static pressure in the inlet ring of the narrowest point. The differential pressure between the static pressures is related to the air volume via the energy conservation rate as follows:

$$q_v = k \cdot \sqrt{\Delta p_w}$$

where k takes into account the specific ring characteristics.

If the fan is operating at a temperature other than 20°C, the following equation can be used to determine the volumetric flow:

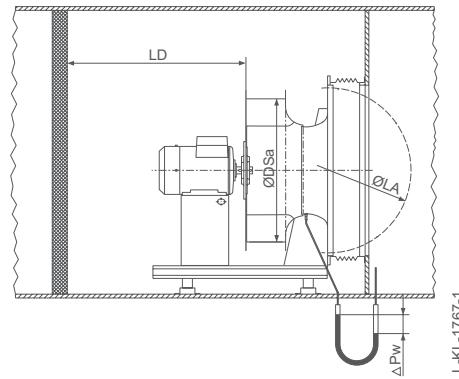

$$q_v = \sqrt{\frac{\rho_{20}}{\rho_{\text{Betr}}}} \cdot k_{20} \cdot \sqrt{\Delta p_w}$$

ρ_{op} = air density at operating temperature

* $\rho = 1,20 \text{ kg/m}^3$

Example:

Example: If an active pressure of 700 Pa is measured for the frame size ER63C, the air flow rate can be calculated

$$q_v = k \cdot \sqrt{\Delta p_w} = 381 \cdot \sqrt{700} = 10080 \text{ m}^3/\text{h}$$

The corresponding active pressure / air flow rate curves can be downloaded from our website under the product information section in the download area.

High-performance centrifugal impeller RH..Cpro / RH..C

Technical description

Description RH..Cpro - ZAmid Technology

- Energy optimised for operation without spiral housing through special three-dimensional blade geometry made of specifically ZAmid technology
- 7 rear-curved blades
- Impeller with backward curved, diffusers for high efficiency and favourable acoustic behaviour
- With embossed rotary direction arrow
- Best impeller efficiency, resulting in conditional reduction of the absorbed power
- Rating plate with specification of the hub size, permissible max speed and balance quality
- With hub half-wedge balancing according to DIN ISO 8821, balance quality G2.5/6.3 according to ISO G 2.5/6.3 according to ISO 1940-1
- Balancing weights made of steel / corrosion resistant material
- Put the impeller through a performance test before installing. A „balance test“ in the installed state is required; possible rebalancing.
- The impellers are designed for continuous duty S1
- Fitting position horizontal and vertical

ZAmid technology

- Reduced weight through ZAmid technology
- Colour RAL 5002
- Reduced noise behaviour
- Same mechanical properties as steel
- From one cast, without welds
- Suitable for high circumferential speed
- Impeller corrosion-free
- Can be used from -20°C to +80°C
- Suitable for use in cleanrooms
- 100% recyclable

Description RH..C- steel

- Energy optimised for operation without spiral housing through special blade design with rotating vaneless diffuser for high efficiency and favourable noise behaviour
- 7 rear-curved blades
- Welded sheet-steel blade design
- Surface protection through powder coating in or liquid painted - RAL 5002
- Enhanced corrosion protection on request
- Rating plate with specification of the hub size, perm. max speed and balance quality
- With glued rotary direction arrow
- Standard design to 80°C
- With hub half-wedge balancing according to DIN ISO 8821, balance quality G 2.5/6.3 according to ISO 1940-1
- Balance weights steel / corrosion resistant material
- Put the impeller through a performance test after installation. A „balance test“ in the installed state is required; possible rebalancing required.
- The impellers are designed for continuous duty S1
- Fitting position horizontal and vertical

Forces and stress during operation

The rotating impeller is stressed through centrifugal and compressive forces in addition to the normal residual imbalance. Residual imbalance denotes the initial imbalance and its amplification during installation (seating related imbalance) and the conditions that change during the course of operation (deformation due to the setting of material through influences of temperature/ stress).

The residual imbalance increases during operation due to sedimentary deposition as well as through the wear and tear of the impeller. Due to the changing residual imbalance during operation, a systematic verification and, if applicable, a rebalancing of the wheel is required (see assembly instructions L-BAL-018).

Additional impeller stress occurs (Wöhler diagram) through start-up / stop procedures, as well as through control operations (acceleration / deceleration phases). Superimposed stress caused by system vibrations and impacts as well as the dynamic oscillations from the system that affect the fan impeller also lead to an increase in impeller stress. „Superimposed characteristic frequencies“ from other system parts (e.g., pipelines, frame structure, etc.) and rotational vibration caused by the drive (frequency inverter, operation) are additional sources of stress. Likewise, additional stress can appear due to temperature effects, fluids, and corrosion / wear (during operation and during standstill).

All of the above-mentioned additional forces are principally of a transient and dynamic nature and cannot be exactly recorded or calculated. A significant indication of the presence of additional stress is an increase in the frequency of vibration (see assembly instructions L-BAL-018). It is important to ensure that the additional stress is kept as low as possible by responding appropriately.

For the starting times for the impellers please see the tables to the left.

Stresses due to start / stop procedures connected with dynamic control in impellers generally lead to fatigue fractures in the shroud and the blade's trailing edge (the crack expands from the weld seam obliquely toward the middle of the blade). If such a use is planned, this is to be stated during the enquiry.

Technical description

Direction of rotation

Clockwise rotation when looking at the inlet of the impeller. In the opposite direction, i.e. impellers with forward curved blades, there is the danger that the motor will overload. It is therefore absolutely necessary to check the direction of rotation before putting the fan into operation.

High-performance centrifugal impeller RH..C

with fixed hub

Description

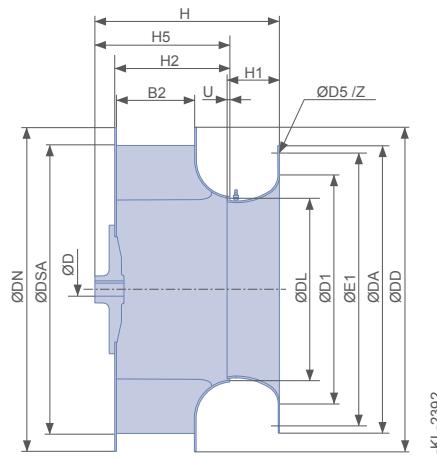

Scope of delivery: Bolted hub with internal diameter

Bore diameter: Specification corresponding to motor classification

Surface protection hub:

NA02 - NA04 (aluminium): bare

NS06 - NS08 (grey cast): oiled

Impeller RH..C with fixed hub
